The Australian Government is not liable in negligence or otherwise for any injury, loss or damage however arising from the use of or reliance on the information provided in this material.

HEALTH NEEDS ASSESSMENT PROCESS

The Murrumbidgee Health Needs Assessment, in line with the firstHealth Board endorsed framework, with governance provided by Clinical Councils, the Community Advisory Committee and the Planning and Integration sub-committee, uses a population approach to needs assessment using person centred planning with a strong commitment to community input.

Murrumbidgee Primary Health Network (MPHN) analyses data from robust gold standard comparable sources such as the Australian Bureau of Statistics and Australian Institute of Health and Welfare in the first instance supplemented by other sources. A decision-making tool is used at MPHN which identifies and prioritises needs based on variables that score local impact relative to national data, where MPHN is in the lowest third of the nation. Further, a Data Prioritisation Tool (refer page 23 for details) is used at a Local Government Area (LGA) level to identify areas where issues/needs are higher in comparison to the New South Wales (NSW) and Murrumbidgee averages. This highlights the LGAs in the lower half of the Murrumbidgee region and is summarised separately in the region profiles on MPHN's website. The matrix scoring is described at the end of this document in more detail. Throughout this document variables scoring three or greater using the matrix are denoted by their respective colour coding, these variables are likely to have higher impact within this LGA.

The use of an LGA approach ensures we are working in alignment with the Murrumbidgee Local Health District (MLHD) health clusters. This allows a more considered co-ordinated approach to services and reduces on duplication of service delivery.

Inequity in healthcare remains a significant issue for many areas in the Murrumbidgee region. Comprehensive socio-economic profiling allows identification of areas where this may affect uptake of healthcare services and consequent poorer health outcomes for those living in these areas. MPHN emphasises in identification of priorities for the region the particular local government areas where efforts should be concentrated in order to address the inequity.

Monitoring of emerging health conditions remains a priority for MPHN with ongoing consultations aimed at identification of emerging issues and subsequent interventions.

MPHN undertakes consultation with key partners, health professionals and community members. Multiple formats are used to undertake these consultations including:

CONVERSATIONS ON THE COUCH

A community consultation approach to capture the needs of people who would not normally engage through a formal process. Community members are invited to meet in a neutral location with high thoroughfare to allow people to chat MPHN staff in a face-to-face environment to discuss health matters important to them. There is no set agenda or questions and is simply an opportunity for people to let MPHN know about health matters important to them and their community. Information gathered during these conversations is collected and used to help MPHN better understand the health needs of our communities.

YARNS ON THE COUCH

Yarns on the Couch is an extension of our Conversations on the Couch with a focus on Aboriginal health. Data collected at both activities is used to help guide the Health Needs Assessment.

HNA COMMUNITY FEEDBACK

There are two options for survey feedback, one short form survey called HNA Mini, and one longer form survey of 17 questions called HNA Community Feedback. Both these survey mechanisms have also been modified to target Aboriginal and Torres Strait Islander people, or those who care for this population group. All these surveys are available year-round and aim to gather information about emerging health needs.

OTHER FEEDBACK MECHANISMS

There are several other opportunities for MPHN to capture feedback from our stakeholders. This includes, but not limited to:

- Incidental feedback from community and health care practitioners to MPHN staff during the normal course of business operations.
- An audit annually of general practice and health care providers to inform workforce capacity.
- MPHN co-design and formal consultation with specific population groups as part of commissioned project work.
- Engagement with MPHN's partners in our various consortium, alliance and steering committee groups. These groups cover various issues relating to Aboriginal health; older people and aged care; mental health, alcohol and other drug, and suicide prevention and aftercare; chronic disease; and emergency response.
- Engagement and feedback with Local Health Advisory Committees (LHACS) which are situated in 33 locations throughout the Murrumbidgee region.
- Feedback from MPHN's governance members, including Board Directors, and members the Community Advisory Committee and four Clinical Councils.
- Review of data collected by its commissioned services throughout the year and other internal data sources to confirm service provision and identify service gaps that may exist.
- · Media and social media monitoring for local emerging health needs and issues.

Once all information is gathered and analysed by MPHN, data is provided back to communities and health providers for validation of the developed priorities from the data.

DATA DISCLAIMER

This report is presented for the purpose of disseminating information for the benefit of people living in Murrumbidgee communities. The report includes data freely available on public websites such as the Australian Institute of Health and Welfare and the Australian Bureau of Statistics.

Data in this report remain confidential and primarily for MPHN's internal use. This report may be shared externally with express permission at the discretion of MPHN's CEO. If the latter is the case data may be used by an external organisation for planning purposes but should not be shared outside that organisation.

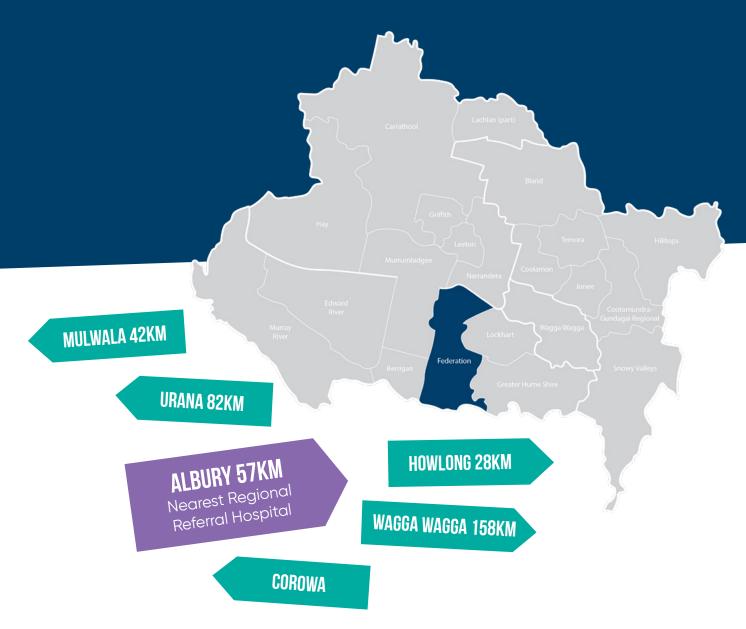

Data from Commonwealth secure confidential websites have not been included in this report. Data have not been interpreted.

MPHN has taken all steps to ensure the information in this report is as accurate as possible and correct at time of report. Data may vary to other publically available sources due to differing sources accessed.

MPHN does not guarantee, and accepts no legal liability whatsoever arising from, or connected to, the use of any material contained in this report. MPHN recommends users exercise their own skill and care with respect to use of this report.

EXECUTIVE SUMMARY

Federation Local Government Area (LGA) is ranked fifth out of 21 LGAs in population size within the Murrumbidgee Primary Health Network (MPHN) (population = 12,589). This LGA has a land area of 5,685 square kilometres (11th largest in MPHN) with a population density of 2.2 people per square kilometre (eight highest in MPHN).

Between 2021 to 2041 the population of Federation LGA is expected to increase by 6.1 per cent, with the population aged 65 years and over expected to increase by almost 40 per cent. Compared to the NSW and MPHN, Federation LGA has a lower socioeconomic index. The proportion of the population aged 65 years and over is higher than both the NSW and MPHN averages. The proportion of the Federation LGA's population who identify as Aboriginal and Torres Strait Islander people (2.0 per cent) is much lower than the MPHN LGA average (5.8 per cent).

Federation LGA has a lower percentage of school leavers participating in higher education, compared to the NSW and MPHN percentages. Across MPHN, this LGA has among the high prevalence of those in the lowest household weekly income bracket (less than \$650 per week). Moreover, the prevalence of aged pensioners, pensioner concession card holders, and those experiencing rental stress exceed that of NSW and MPHN. Compared to other MPHN LGAs, Federation LGA has a higher percentage of people aged 85 years and over living alone.

The median age of death for males and females is equivalent to that of NSW and MPHN. However, for both sexes, Federation LGA has a higher premature death rate than NSW and other MPHN LGAs. The rates of premature deaths from cancer are above the NSW and MPHN rates. Deaths from transport accidents are twofold and fivefold above NSW and MPHN rates, respectively. The death rate from ischaemic heart disease and circulatory system diseases in this LGA is higher than that of other MPHN LGAs. The incidence of bowel cancer is higher than MPHN's average. Compared to the NSW and MPHN levels, within the Federation LGA, there is a higher prevalence of those aged 15 years and over who report living with a mental health condition, including depression or anxiety.

Prevalent risk factors in Federation LGA include a higher than the NSW and MPHN average for people reporting low, very low, or no exercise, males, and females aged 18 years and over who are overweight, males who currently smoke, and males who report risky alcohol consumption. The Federation LGA has a higher than MPHN average rate of possession and use of amphetamines.

'Premature mortality' refers to deaths that occur at an age earlier than a selected cut-off. For this analysis, deaths among people aged under 75 are considered premature.

TECHNICAL NOTES

MPHN LGA DATA PRIORITISATION TOOL

MPHN's Data Prioritisation Tool applies a score based on the LGA result in relation to the state average and Murrumbidgee average results.

A score of zero to four is applied based on the difference between the LGA proportion or Age Standardised Rate (ASR) (see page 24 for explanation) result compared to the NSW average score.

Within the list of LGA scores, a score of one is given to the LGAs with either a higher or lower score than the average for the Murrumbidgee region.

The two scores are summed to give a total score.

To highlight the impacts, colour coding is applied to the range of 0-5 totals of both the NSW and Murrumbidgee averages combined.

MPHN's LGA Data Prioritisation Tool is also applied to socio-demographic variables such as age, gender etc.

MATRIX SCORING SYSTEM COMPARED TO THE NSW AVERAGE				
PROPORTION	ASR (Two digit response)	ASR (Three digit response)	SCORE	
Less than 0 or negative score	Less than 0 or negative score	Less than 0 or negative score	0	
0 and 10%	0 -10	0 - 100	1	
10.1% - 29.9%	11 – 30	101-300	2	
30% - 49.9%	31 - 50	301 - 500	3	
>50%	51 +	501 +	4	
Higher or lower than Murrumbidgee average dependent on orientation of response (positive or negative)

The following notes provide a definition for terms used in this report that may not be familiar to readers.

SOCIO-ECONOMIC INDEXES FOR AREAS (SEIFA)

The SEIFA score in this report is an index score that allows geographical ranking in Australia. The score measures socio-economic advantage and disadvantage, information is obtained from the five-yearly Australian Census.

SEIFA is a group of four indexes, which are used to rank areas broadly by their level of advantage or disadvantage. It consists of four measures:

- · Index of Relative Socio-Economic Advantage-Disadvantage
- Index of Relative Socio-Economic Disadvantage
- Index of Education and Occupation
- Index of Economic Resources

Some examples of variables that are measured and form the indexes are (this is limited, there are more variables that are considered):

- Percentage of low-income households
- Unemployment rate
- Percentage of low-skilled occupations and people without qualifications
- · Percentage of households without a car
- Percentage of people living overcrowded dwellings
- Percentage of people under 70 with a disability
- Percentage of children with jobless parents
- Percentage of people with poor English proficiency

SEIFA scores are expressed on a scale where lower numbers always mean more disadvantage and less advantage, while higher numbers mean less disadvantage and more advantage. They are standardised so that the average for Australia is always close to 1,000.

AGE STANDARDISED RATE (ASR)

A method of adjusting the crude rate to eliminate the effect of differences in population age structures when comparing crude rates for different periods of time, different geographic areas and/or different population sub-groups (e.g. between one year and the next and/or States and Territories, Indigenous and non-Indigenous populations).

Adjustments are usually undertaken for each of the comparison populations against a standard population (rather than adjusting one comparison population to resemble another). Sometimes a comparison population is referred to as a study population.

ASRs are usually used for valid comparisons of rates in different populations, such as incidence rates, prevalence rates, mortality rates and health service utilisation rates.

An example of why they are used is because the numbers of deaths per 100,000 population are influenced by the age distribution of the population. Two populations with the same age-specific mortality rates for a cause of death will have different overall death rates if the age distributions of their populations are different. Age standardized mortality rates adjust for differences in population age distribution by applying the observed age-specific mortality rates for each population to a standard population. The age-standardised mortality rate is a weighted average of the age-specific mortality rates per 100,000 persons, where the weights are the proportions of persons in the corresponding age groups of the standard population.
